1. 使用的是 element dispatch

若有 n 條 thread,將相乘的矩陣轉換成方陣相乘

Thread 1 做 0、n、2n....行與列的矩陣乘法

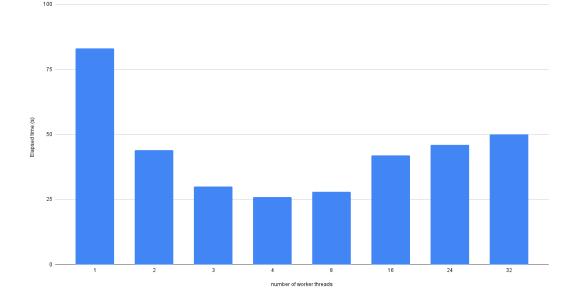

Thread 2 做 1、n+1、2n+1....行與列的矩陣乘法

Thread 3 做 2、n+2、2n+2....行與列的矩陣乘法

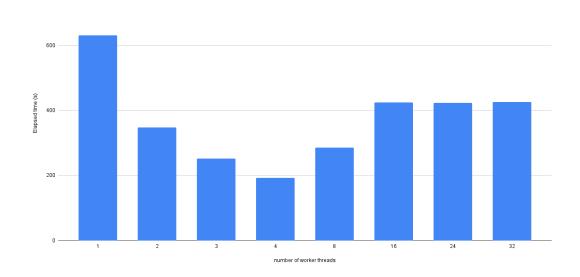

•••

Thread n 做 n、2n、3n....行與列的矩陣乘法

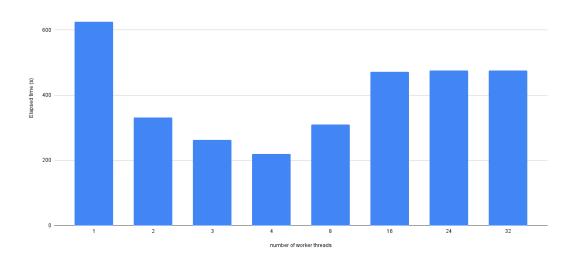

Elapsed time with different number of worker threads(test_case1)

Elapsed time with different number of worker threads(test_case2)

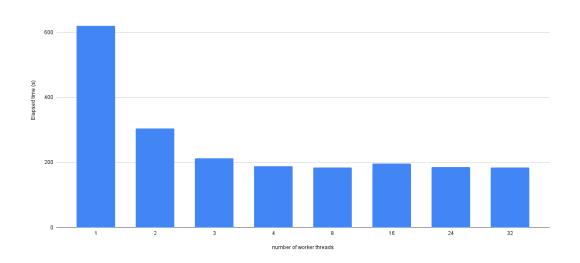

800

Elapsed time with different number of worker threads(test_case4)

800

Summary:

Thread 數量越接近 core(4 個) ,花費的時間越少

Thread 數量大於 core,越大花費的時間增加越少,最終趨近飽和

Thread 數量小於 core,越小花費的時間越多
